Total Mark : 40  
Marks Obtained : 39

### Section 1 : Coding

#### 1. Problem Statement

Emily is a librarian who keeps track of books borrowed and returned by her patrons. She maintains four sets of book IDs: the first set represents books borrowed, the second set represents books returned, the third set represents books added to the collection, and the fourth set represents books that are now missing. Emily wants to determine which books are still borrowed but not returned, as well as those that were added but are now missing. Finally, she needs to find all unique book IDs from both results.

Help Emily by writing a program that performs the following operations on four sets of integers:

Compute the difference between the borrowed books (first set) and the returned books (second set). Compute the difference between the added

books (third set) and the missing books (fourth set). Find the union of the results from the previous two steps, and sort the final result in descending order.

### ***Input Format***

The first line of input consists of a list of integers representing borrowed books.

The second line of input consists of a list of integers representing returned books.

The third line of input consists of a list of integers representing added books.

The fourth line of input consists of a list of integers representing missing books.

### ***Output Format***

The first line of output displays the difference between sets P and Q, sorted in descending order.

The second line of output displays the difference between sets R and S, sorted in descending order.

The third line of output displays the union of the differences from the previous two steps, sorted in descending order.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 1 2 3

2 3 4

5 6 7

6 7 8

Output: [1]

[5]

[5, 1]

### ***Answer***

```
P = set(map(int, input().split()))
```

```
Q = set(map(int, input().split()))
```

```
R = set(map(int, input().split()))
S = set(map(int, input().split()))

borrowed_not_returned = sorted(P - Q, reverse=True)
added_not_missing = sorted(R - S, reverse=True)

final_result = sorted(set(borrowed_not_returned) | set(added_not_missing),
reverse=True)

print(borrowed_not_returned)
print(added_not_missing)
print(final_result)
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Alex is tasked with managing the membership lists of several exclusive clubs. Each club has its own list of members, and Alex needs to determine the unique members who are part of exactly one club when considering all clubs together.

Your goal is to help Alex by writing a program that calculates the symmetric difference of membership lists from multiple clubs and then finds the total number of unique members.

### **Input Format**

The first line of input consists of an integer  $k$ , representing the number of clubs.

The next  $k$  lines each contain a space-separated list of integers, where each integer represents a member's ID.

### **Output Format**

The first line of output displays the symmetric difference of the membership lists as a set.

The second line displays the sum of the elements in this symmetric difference.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 3

1 2 3

2 3 4

5 6 7

Output: {1, 4, 5, 6, 7}

23

### **Answer**

```
k = int(input())
```

```
club_sets = []
```

```
for _ in range(k):  
    members = set(map(int, input().split()))  
    club_sets.append(members)
```

```
sym_diff = club_sets[0]
```

```
for i in range(1, k):  
    sym_diff = sym_diff.symmetric_difference(club_sets[i])
```

```
print(sym_diff)  
print(sum(sym_diff))
```

**Status :** Partially correct

**Marks :** 9/10

### **3. Problem Statement**

Riya owns a store and keeps track of item prices from two different suppliers using two separate dictionaries. He wants to compare these prices to identify any differences. Your task is to write a program that calculates the absolute difference in prices for items that are present in both dictionaries. For items that are unique to one dictionary (i.e., not present in the other), include them in the output dictionary with their original prices.

Help Riya to implement the above task using a dictionary.

### ***Input Format***

The first line of input consists of an integer  $n_1$ , representing the number of items in the first dictionary.

The next  $n_1$  lines contain two integers

1. The first line contains the item (key), and
2. The second line contains the price (value).

The following line consists of an integer  $n_2$ , representing the number of items in the second dictionary

The next  $n_2$  lines contain two integers

1. The first line contains the item (key), and
2. The second line contains the price (value).

### ***Output Format***

The output should display a dictionary that includes:

1. For items common to both dictionaries, the absolute difference between their prices.
2. For items that are unique to one dictionary, the original price from that dictionary.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 1

4

4

1

8

7

Output: {4: 4, 8: 7}

**Answer**

```
n1 = int(input())
dict1 = {}
for _ in range(n1):
    key = int(input())
    value = int(input())
    dict1[key] = value
n2 = int(input())
dict2 = {}
for _ in range(n2):
    key = int(input())
    value = int(input())
    dict2[key] = value

result = {}
for key in dict1:
    if key in dict2:
        result[key] = abs(dict1[key] - dict2[key])
    else:
        result[key] = dict1[key]
for key in dict2:
    if key not in dict1:
        result[key] = dict2[key]

print(result)
```

**Status :** Correct**Marks :** 10/10**4. Problem Statement**

Samantha is working on a text analysis tool that compares two words to find common and unique letters. She wants a program that reads two words, w1, and w2, and performs the following operations:

Print the letters common to both words, in alphabetical order. Print the letters that are unique to each word, in alphabetical order. Determine if the set of letters in the first word is a superset of the letters in the second word. Check if there are no common letters between the two words and print the result as a Boolean value.

Ensure the program ignores case differences and leading/trailing spaces in the input words.

Your task is to help Samantha in implementing the same.

### ***Input Format***

The first line of input consists of a string representing the first word, w1.

The second line consists of a string representing the second word, w2.

### ***Output Format***

The first line of output should display the sorted letters common to both words, printed as a list.

The second line should display the sorted letters that are unique to each word, printed as a list.

The third line should display a Boolean value indicating if the set of letters in w1 is a superset of the set of letters in w2.

The fourth line should display a Boolean value indicating if there are no common letters between w1 and w2.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: program

Peace

Output: ['a', 'p']

['c', 'e', 'g', 'm', 'o', 'r']

False

False

### ***Answer***

```
# Read input and clean it
```

```
w1 = input().strip().lower()
```

```
w2 = input().strip().lower()
```

```
set1 = set(w1)
set2 = set(w2)
common = sorted(set1 & set2)

unique = sorted((set1 ^ set2))

is_superset = set1.issuperset(set2)

no_common = set1.isdisjoint(set2)
print(common)
print(unique)
print(is_superset)
print(no_common)
```

**Status :** Correct
