Total Mark : 30
Marks Obtained : 25

Section 1 : Coding

1. Problem Statement

Raja needs a program that helps him manage his shopping list efficiently. The program should allow him to perform the following operations:

Add Items: Raja should be able to add multiple items to his shopping list at once. He will input a space-separated list of items, each item being a string.

Remove Item: Raja should be able to remove a specific item from his shopping list. He will input the item he wants to remove, and if it exists in the list, it will be removed. If the item is not found, the program should notify him.

Update List: Raja might realize he forgot to add some items initially. After removing unnecessary items, he should be able to update his list by adding more items. Similar to the initial input, he will provide a space-separated

list of new items.

Input Format

The first line consists of the initial list of integers should be entered as space-separated values.

The second line consists of the element to be removed should be entered as a single integer value.

The third line consists of the new elements to be appended should be entered as space-separated values.

Output Format

The output displays the current state of Raja's shopping list after each operation. After adding items, removing items, and updating the list, the program prints the updated shopping list in the following format:

"List1: [element1, element2, ... ,element_n]

List after removal: [element1, element2, ... ,element_n]

Final list: [element1, element2, ... ,element_n]".

If the item is not found in the removing item process, print the message "Element not found in the list".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 1 2 3 4 5

3

6 7 8

Output: List1: [1, 2, 3, 4, 5]
List after removal: [1, 2, 4, 5]
Final list: [1, 2, 4, 5, 6, 7, 8]

Answer

```
# You are using Python
x=input()
l=list(map(int,x.split()))
print(f"List1: {l}")
n=int(input())
for i in range(len(l)):
    if(l[i]==n):
        del l[i]
        print(f"List after removal: {l}")
        break
else:
    print("Element not found in the list")
s=input()
l1=list(map(int,s.split()))
for i in l1:
    l.append(i)
print(f"Final list: {l}")
```

Status : Correct

Marks : 10/10

2. Problem Statement

A company is creating email accounts for its new employees. They want to use a naming convention for email addresses that consists of the first letter of the employee's first name, followed by their last name, followed by @company.com.

The company also has a separate email domain for administrative employees.

Write a program that prompts the user for their first name, last name, role, and company and then generates their email address using the appropriate naming convention based on their role. This is demonstrated in the below examples.

Note:

The generated email address should consist of the first letter of the first name, the last name in lowercase, and a suffix based on the role and company, all in lowercase.

Input Format

The first line of input consists of the first name of an employee as a string.

The second line consists of the last name of an employee as a string.

The third line consists of the role of the employee as a string.

The last line consists of the company name as a string.

Output Format

The output consists of a single line containing the generated email address for the employee, following the specified naming convention.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: John
Smith
admin
iamNeo

Output: jsmith@admin.iamneo.com

Answer

You are using Python

```
a=input()
b=input()
c=input()
d=input()
if(c=="admin"):
    print(f"{a[0].lower()}{b.lower()}@{c.lower()}.{d.lower()}.com")
else:
    print(f"{a[0].lower()}{b.lower()}@{d.lower()}.com")
```

Status : Correct

Marks : 10/10

3. Problem Statement

Write a program to check if a given string is perfect.

A perfect string must satisfy the following conditions:

The string starts with a consonant. The string alternates between consonants and vowels. Each consonant appears exactly once. Vowels can occur consecutively multiple times but should not be followed immediately by a consonant.

If the string satisfies all these conditions, print "True"; otherwise, print "False".

Input Format

The input consists of a string.

Output Format

The output prints "True" if the string is perfect. Otherwise, print "False".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: capacitor

Output: True

Answer

```
def isp(s):
    v="aeiou"
    c="bcdfghjklmnpqrstvwxyz"
    if(s[0] not in c):
        return False
    cc={}
    for i in range(len(s)):
        if i%2==0:
```

```
    if(s[i] not in c):
        return False
    if(s[i] in cc):
        return False
    cc[s[i]]=1
    else:
        if(s[i] not in v):
            return False
        if i>0 and s[i-1] in v and s[i] not in v:
            return False
    return True
s=input()
if isp(s):
    print("True")
else:
    print("False")
```

Status : Partially correct

Marks : 5/10
